ABSTRACT

Wild grown European blackberry Rubus fruticosus plants are widespread in different parts of northern countries and have been extensively used in herbal medicine. The result show that European blackberry plants are used for herbal medicinal purpose such as antimicrobial, anticancer, antidiabetes, antidiarrheal, and also good antioxidant. Blackberry plant (R. fruticosus) contains tannins, gallic acid, villosin, and iron; fruit contains vitamin C, niacin (nicotinic acid), pectin, sugars, and anthocyanins and also contains of berries albumin, citric acid, malic acid, and pectin. Some selected physicochemical characteristics such as berry weight, protein, pH, total acidity, soluble solid, reducing sugar, vitamin C, total antioxidant capacity, antimicrobial screening of fruit, leaves, root, and stem of R. fruticosus, and total anthocyanins of four preselected wild grown European blackberry (R. fruticosus) fruits are investigated. Significant differences on most of the chemical content detect among the medicinal use. The highest protein content (2%), the genotypes with the antioxidant activity of standard butylated hydroxyanisole (BHA) studies 85.07%. Different cultivars grown in same location consistently show differences in antioxidant capacity.

Key words: Anticancer, antidiabetic, antidysentery, antimicrobial, antioxidant, blackberry, phototherapeutics, R. fruticosus, rosaceae

INTRODUCTION

In British folk medicine, the bramble has a reputation for curing and preventing a wide variety of ailments.[1] The species of blackberry (Rubus fruticosus) most common in Britain is naturalized throughout most of the world, including north America. In folk medicinal records, it is often not possible to trace the actual species used in the past. Blackberry root is one component of a decoction used to treat dysentery.[2] Blackberry root has been used to treat diarrhea.[3] Blackberry bush has been used to treat whooping cough.[4] Blackberry juice has been recommended for colitis.[5] Whereas a tea made from the roots has been used for labor pain.[6] The leaves of the blackberry have been chewed for toothache.[7] The berry is a powerful source of antioxidant.[8] R. fruticosus (European blackberry, European bramble, known as vilayati anchhu) is cultivated in the valley of Kashmir, Assam, and Tamilnadu (India) up to 2000 meter. The plant gave triterpenic acid and rubitic acid characterized as 7 alpha-hydroxyursolic acid.[9] Blackberries are notable for their high nutritional contents of dietary fiber, vitamin C, vitamin K, and the essential mineral manganese.[10] The root contains saponins and tannins, whereas leaf contains fruits acid, flavonoids, and tannins.[11] Fruits are gathered (as of most other blackberries) in the wild for jam, syrups, wine, and liqueur. Because there are many similar species, it seems doubtful, whether the reports refer really to this species.[12] Blackberry is a perennial shrub. It has sprawling, woody, and thorny stems. They can reach the height of about 5 meters. It has dark green hairy leaves, toothed along the margins. Leaves grow in clusters of three to five. Flowers are white to pale pink, appearing from late summer until autumn. Fruits are the well-known fleshy black berries.[13]

Description

In its first year, a new stem, the primocane, grows vigorously to its full length of 3-6 m (in some cases, up to 9 m), arching or trailing along the ground and bearing large palmately compound leaves with five or seven leaflets; it does not produce any flowers. In its second year, the cane becomes a floricane and the stem does not grow longer, but the lateral buds break to produce flowering laterals (which have smaller leaves with three or five
First and second year shoots usually have numerous short-curved very sharp prickles that are often erroneously called thorns. These prickles can tear through denim with ease and make the plant very difficult to navigate around. Unmanaged mature plants form a tangle of dense arching stems, the branches rooting from the node tip on many species when they reach the ground. Vigorous and growing rapidly in woods, scrub, hillsides, and hedgerows, blackberry shrubs tolerate poor soils, readily colonizing wasteland, ditches, and vacant lots.\[15,16\] The flowers are produced in late spring and early summer on short racemes on the tips of the flowering laterals. Each flower is about 2-3 cm in diameter with five white or pale pink petals. The newly developed primocane fruiting blackberries flower and fruit on the new growth.\[17\]

**Stem**
Canes arched or trailing up to 7-meter long, green, purplish or red, smooth or moderately hairy, round or angled, with numerous curved or straight prickles of different sizes.

**Leaves**
Compound with three or five oval leaflets. Leaflets are usually dark-green above and lighter green beneath, with small teeth around the edges.\[19\]

**Flowers**
White or pink, 2-3 cm in diameter, formed in clusters at the ends of short branches; petals five.

**Fruit**
A berry changing color from green to red to black as it ripens, 1-3 cm in diameter, consisting of an aggregate of fleshy segments or drupelets, each containing one seed.

**Seed**
Light to dark brown, somewhat triangular, 2-3-mm long, deeply and irregularly pitted.

**Root**
Most roots occur in the top 20 cm of soil but a few are up to 1-m deep; there is a well-defined crown at ground level.\[19\]

**Taxonomy**
Botanical name: *R. fruticosus* L. aggregate-Family Rosaceae (rose family) [Figure 1].

Blackberry comprises a number of closely related plants that for convenience are dealt with (aggregated) under the one Latin name. On a world scale, *R. fruticosus* includes approximately 2000 named species, subspecies, and varieties and belongs to the family of the Rosaceae (Rose Family), which is collectively referred to as taxa. The identities and correct names of the taxa occurring in Australia require clarification.

**Standard common name**
Blackberry, also known as European blackberry.
a surveyor autosampler, pump and photo diode array (PDA) detector and a Thermo Finnigan mass spectrometer ion trap.\textsuperscript{[23,27]} Blackberry fruits are well known to be a rich source of polyphenols and to exhibit high antioxidant capacity.\textsuperscript{[23,27]}

**PHYTOCONSTITUENTS**

The plant materials contain various type of phytochemical constituents such as alkaloids, flavonoids, tannins, saponins, glycosides, terpenoids, sterols, and carbohydrates.\textsuperscript{[26-28]} It also contains ascorbic acid, organic acids, tannins, and volatile oils.\textsuperscript{[29]} On the basis of these chemical constituents, the plant is very useful antidiarrheal and soothes inflamed mucosa. Decoction of leaves is used as a tonic and gargle. Poultice of the leaves is applied to abuses and skin ulcers.\textsuperscript{[30,31]} Blackberries contain numerous phytochemical including polyphenols, flavonoids, anthocyanins, salicylic acid, ellagic acid, and fiber.\textsuperscript{[32,33]} Blackberries have both soluble and insoluble fiber.\textsuperscript{[33]}

**MEDICAL USES**

Blackberries are known for their anticancer properties. As they contain antioxidants, they are known to destroy the free radicals that harm cells and can lead to cancer. They also help protect and strengthen the immunity, which lowers the risk of cancer. They are especially helpful when it comes to reducing the risk of esophageal, cervical, and breast cancer.\textsuperscript{[34]} Blackberry leaves have been traditionally used in herbal medicine as an antimicrobial agent and for their healthful antioxidant properties. A laboratory study was published in the “International Journal of Antimicrobial Agents” in July 2009.\textsuperscript{[35]} Young blackberry leaves have high levels of antioxidants, or oxygen radical absorbance capacity, according to a study conducted by the U.S. Department of Agriculture's Agricultural Research Service and published in the “Journal of Agricultural Food Chemistry” in February 2000.\textsuperscript{[36]} R. fruticosus has been used in Europe to treat diabetes. An extract of the leaves showed a hypoglycemic effect on diabetic rats.\textsuperscript{[37]} Blackberry leaves and roots are a long-standing home remedy for anemia, regulates menses, diarrhea, and dysentery. The fruit and juice are taken for anemia. A standard infusion made, which can also be applied externally as a lotion, reported to cure psoriasis and scaly conditions of the skin. Blackberries are also used to make wine, brandy, and flavor liqueurs and cordials.\textsuperscript{[38]} They are used to treat sore throats, mouth ulcers, and gum inflammations. A decoction of the leaves is useful as a gargle in treating thrush and also makes a good general mouthwash.\textsuperscript{[39]}

**TRADITIONAL USES**

Because the plant is strongly astringent, infusions are used to relieve diarrhea. As a mouthwash, it is used to strengthen spongy gums and ease mouth ulcers. The berries make a pleasant gargle for swallowing. Poultices or compresses are used externally on wounds and bruises. Decoctions are used to relieve diarrhea and hemorrhoids. The tannins in the herb not only tighten tissue but also help to control minor bleeding.\textsuperscript{[40]}

**CONCLUSION**

Plants of *R. fruticosus* are widespread in northern countries of the world. It has a lot of medicine use. Various blackberry plants are useful in the treatment of cancer, dysentery, diarrhea, whooping cough, colitis, toothache, anemia, psoriasis, sore throat, mouth ulcer, mouthwash, hemorrhoids, and minor bleeding. *R. fruticosus* has different pharmacological activities like anticancer, antimicrobial, antioxidant, antisyndentery, antiabetic, and antidiarreal. This review article has reestablished various properties of “Rubus fruticosus” and pharmacological activities of plant with various phytochemical constituents such as alkaloids, flavonoids, tannins, saponins, glycosides, terpenoids, sterols, and carbohydrates. It also contains ascorbic acid, organic acids, tannins, and volatile oils.
